Process & Decision Documentation

Project/Assignment Decisions

Use this section to document key decisions that shape the direction, scope, or outcome of the assignment. The purpose is to make your judgement and reasoning visible, not to record every action taken.

What you include here should reflect decisions that mattered: moments where you chose one path over another, changed direction, or adapted to constraints.

The expected length and detail depend on the assignment.

Side Quests and A4 (Individual Work)

Keep this section brief, typically 2 to 4 sentences.

Focus on: Refining the game and replacing assets, adding another level and sound effect

Entry Header

Name: Suyao Liu

Role(s): Programmer and designer

Primary responsibility for this work: Updating the Example 4 platformer code so the game works correctly with the new assets and mechanics

Goal of Work Session

The goal of this work session was to update the Example 4 platformer so it works correctly with the new assets I created and added. This included replacing the original player, enemy, collectible, and background assets while preserving the existing gameplay systems such as movement, enemy patrol, hazards, collectibles, HUD, and restart behavior. I also wanted to improve the gameplay experience by fixing bugs, adjusting difficulty, and adding sound effects and background music.

Tools, Resources, or Inputs Used

- p5.js and p5.play
- Visual Studio Code
- Prior Example 4 platformer code
- Custom game assets (player, boar enemy, diamond collectible, backgrounds)
- ChatGPT (GenAI) for debugging support and code patch suggestions

GenAI Documentation

Everyone must complete this section. If not GenAI was used, write, “No GenAI used for this task.” When GenAI is not used, process evidence should still demonstrate iteration, revision, or development over time.

Because GenAI can closely mimic human-created work, instructors or TAs may occasionally request additional process evidence to confirm non-use. This may include original working files (e.g., an illustrator file), intermediate drafts, or a brief check-in with a TA to walk through your process.

These requests are not an assumption of misconduct. They are part of ensuring academic integrity in an environment where distinguishing between human-created and AI-generated work is increasingly difficult.

If GenAI was used (keep each response as brief as possible):

Date Used: 2026-03-07

Tool Disclosure: Codex

Purpose of Use: I used GenAI to help identify which parts of the Example 4 code needed to be patched after replacing the original assets. I also used it for debugging problems related to animation frames, restart behavior, collectible states, and sound implementation.

Summary of Interaction: I gave it commend to fix bugs and it debug the code for me

Human Decision Point(s): I reviewed each suggested code change and only applied the parts that fit the structure of Example 4. I rejected suggestions that would restructure the game into a different architecture or add unnecessary complexity. I also adjusted several values manually, such as player scale, enemy count, fire size, and collectible alignment, based on testing inside the browser.

Integrity & Verification Note: After applying each change, I tested the game in the browser to confirm that gameplay systems still worked correctly. I checked that the player could move, jump, attack, collect diamonds, take damage, and restart the game without breaking the level. I also verified that sound effects played only once per event and did not trigger repeatedly. I played the whole game again and again.

Scope of GenAI Use: GenAI was used only to help with debugging suggestions and understanding the existing code structure. The asset creation, level redesign, and final code decisions were completed by me.

Limitations or Misfires: It gave me poor level structure design I had to redesign it manually, and it gave me a lot of bugs

Summary of Process (Human + Tool)

I replaced the original Example 4 assets with my own player, enemy, collectible, and background files and then patched the existing code so the new sprite sheets and animations would work without changing the overall structure of the game. During testing, several issues appeared, including incorrect sprite alignment, diamond animation problems, duplicated enemies after restarting, and gameplay that felt too difficult. I fixed these by adjusting frame sizes, correcting the diamond idle and collected states, reducing the number of enemies, making hazards smaller, and improving the restart logic. I also added sound effects and background music and repeatedly tested the game in the browser to confirm that movement, jumping, attacking, collectibles, hazards, HUD, camera, and restart systems continued to function correctly.

Decision Points & Trade-offs

One of the key decision I made was to use the level designed for me by Codex, because it's unplayable, the collectables are unreachable and the enemy are responding at unwanted place, the platform too high to reach etc., I redesign the whole level by hand.

Verification & Judgement

I verified the changes mainly through playtesting. After each update, I ran the game in the browser to confirm that the player could move, jump, attack enemies, collect diamonds, take damage from hazards, and restart the game without breaking the level. I also checked that animations displayed correctly, that collectibles disappeared after being collected, and that sound effects triggered once per action instead of repeating every frame.

Limitations, Dead Ends, or Open Questions

Some issues required compromise during development. The collectible sprite sheet originally contained only one row, which limited how the collected animation could be displayed, so adjustments were made to support a simple two state system. Another limitation involved restarting the game, since rebuilding the world dynamically caused additional bugs, so a full reset approach was used to ensure the game restarted cleanly. Future improvements could include a more advanced restart system and additional level balancing.

Appendix

Please include a full transcript of your conversation with the GenAI. GenAI transcripts are used for transparency and verification only and are not assessed for writing quality or completeness.

Note: If GenAI is used in another language, you must include both the original language and a translated transcript in the appendix

I am working from Example 4 of a GBDA 302 p5.play platformer project. I have already replaced and added my assets, including the background layers, and I need you to update the game code so everything works correctly with the new files. Important rules: - Keep the project based on Example 4 only - Do not refactor it into Example 5 - Patch the existing Example 4 code in place - Preserve the current gameplay systems unless a change is necessary for the new assets - Keep movement, jump, attack, enemy patrol, hazards, collectibles, HUD, camera, restart, and game over working My current replacement assets are already prepared: Player sprite sheet: - filename: kinghuman_sprites.png - this is one combined single PNG - row 0 = idle - row 1 = run - row 2 = jump - row 3 = attack - row 4 = hit - row 5 = dead - frame width = 78 - frame height = 58 - idle = 11 frames - run = 8 frames - jump = 1 frame - attack = 3 frames - hit = 2 frames - dead = 4 frames Enemy sprite sheet: - filename: boar_sprites.png - this is one combined single PNG - row 0 = idle - row 1 = run - row 2 = jump - row 3 = attack - row 4 = hit - row 5 = dead - frame width = 34 - frame height = 28 - idle = 11 frames - run = 5 frames - jump = 1 frame - attack = 4 frames - hit = 2 frames - dead = 4 frames - use run for patrol - use hit and dead if existing enemy damage logic supports them Collectible sprite sheet: - filename: diamond.png - this is the replacement for leafSpriteSheet.png - inspect the sheet and determine the correct row and frame count from the actual file - if there is only one animated row, use that as the collectible idle animation - keep collectible behavior the same as the original leaf system Background layers: - bg-1.png - bg-2.png - bg-3.png - use these as the new parallax background layers in place of the original background images - preserve the existing parallax effect if Example 4 already supports it Audio files: - jump sound.mp3 for jumping - attacking.mp3 for attacking - hurt.mp3 for taking damage - coin.mp3 for collecting the diamond - gameover.mp3 for death or game over - bgmusic1.mp3 and bgmusic2.mp3 for looping background music Tasks: 1. Inspect the existing Example 4 code first before changing anything 2. Find exactly where the player sprite sheet is loaded 3. Find exactly where the enemy sprite sheet is loaded 4. Find exactly where the collectible sprite sheet is loaded 5. Find exactly where the background layers are loaded 6. Find where frame

width, frame height, animation rows, and frame counts are defined 7. Update those locations only, unless another change is necessary 8. Replace the old fox player art with kinghuman_sprites.png 9. Replace the old boar enemy art with boar_sprites.png 10. Replace the old leaf collectible art with diamond.png 11. Replace the old background layers with bg-1.png, bg-2.png, and bg-3.png 12. Update animation definitions so the new assets animate correctly 13. Adjust visual offsets, scale, or animation alignment only if necessary 14. Keep collision boxes and gameplay logic as stable as possible 15. Make sure the larger king human sprite still lines up with the ground properly 16. Make sure the enemy still patrols correctly and turns around at edges 17. Make sure collectibles still disappear and update the score counter 18. Make sure the new background layers render in the correct order and still look good with parallax 19. Add sound effects for jump, attack, hurt, collect, and game over 20. Add looping background music 21. Make sure sounds trigger once per gameplay event and do not spam every frame 22. Handle browser audio restrictions properly if needed, such as starting audio after user interaction 23. Do not remove any existing features Extra level update requirement: - Lightly redesign the existing level so it looks different from the original Example 4 - Keep the same general structure and tile parsing system - Do not make the level unfair or broken - Move some platforms, collectibles, enemies, or hazards so it clearly looks updated What I want from you: - First, briefly explain what parts of Example 4 need to be patched - Then give me the exact code edits - Show the full updated code for each changed file if that is cleaner - Clearly mark any new constants, animation objects, preload changes, background changes, and sound logic - Comment every important change - At the end, give me a short checklist of any manual file renaming or asset placement I still need to do Be careful: - Do not invent new filenames beyond the ones I gave you - Do not assume Example 5 architecture - Do not rewrite the entire game from scratch - Do not simplify the game - Work directly with Example 4 structure - If the collectible sheet needs inspection to determine rows and frame counts, inspect it from the provided file and choose the correct setup instead of guessing

Worked for 2m 31s

Patched in-place on Example 4 only: sketch.js

What I patched

- Asset preload filenames (player/enemy/collectible/backgrounds/audio)
- Animation row/frame definitions for kinghuman_sprites.png and boar_sprites.png
- Collectible animation setup for diamond.png after file inspection (180x28 => 9 frames, single row)
- Sprite-sheet frame sizes (separate player/boar/collectible frame constants)
- Minor visual offset alignment for larger player + boar
- Kept movement/jump/attack/patrol/hazards/collect/HUD/camera/restart/game-over systems intact
- Added one-shot SFX triggers (jump/attack/hurt/collect/game over)
- Added browser-safe audio unlock + looping background music using bgmusic1.mp3 and bgmusic2.mp3
- Lightly redesigned level rows (same tile parser/system), updated win target to match collectible count

Exact edit locations

- Player anim defs: sketch.js (line 30)
- Boar anim defs: sketch.js (line 44)
- Level redesign: sketch.js (line 112)
- New frame constants (PLAYER_FRAME_W/H, BOAR_FRAME_W/H, collectible): sketch.js (line 135)
- WIN_SCORE updated for redesigned level: sketch.js (line 151)
- Preload replacements + audio loads: sketch.js (line 212)

- Audio unlock-on-interaction: sketch.js (line 255)
- Attack/jump SFX event hooks: sketch.js (line 309)
- Collect/hurt hooks: sketch.js (line 557), sketch.js (line 575), sketch.js (line 594)
- Restart death-audio reset + boar anim size in respawn: sketch.js (line 991)
- World build updates (boar/diamond/player frame configs): sketch.js (line 1107)
- Parallax layer sources still preserved order/speeds: sketch.js (line 1260)
- New audio helper functions: sketch.js (line 1268)

Manual checklist (you still need)

1. Put these files in `assets/` with exact names:
   `jump sound.mp3`, `attacking.mp3`, `hurt.mp3`, `coin.mp3`, `gameover.mp3`, `bgmusic1.mp3`, `bgmusic2.mp3`
2. Confirm browser first interaction (key/mouse/touch) starts music (required by autoplay policy).
3. Playtest once for visual alignment; if feet look a little high/low, tweak only `player.anis.offset.y` at sketch.js (line 1184).

I could not run the game in a browser from here, so final runtime verification is still needed on your side.

make the human king smaller and fix the diamond and the nemy the diamond should be changing each fram instead of scrolling through the frames, and the enemys are too many

Worked for 53s

Patched. I made all 3 requested fixes in sketch.js:

1. King is smaller
   - Added `player.scale = 0.75;` at sketch.js (line 1186)
2. Diamond animation fixed (no more scrolling artifact)
   - Corrected sheet slicing to real dimensions:
     - `COLLECT_FRAME_W = 18`
     - `COLLECT_FRAMES = 10`
       at sketch.js (line 139)
   - Set animation to change every frame:
     - `frameDelay: 1`
       at sketch.js (line 1125)
3. Fewer enemies
   - Reduced boar spawns in level map from 7 to 3 by editing rows 1, 4, 5, and 8 at sketch.js (line 112)

If you want, I can tune the king size one more step (0.7 or 0.8) based on how it looks in your browser.

Undo

sketch.js

fix the game the pig is everywhere make sure when the game is restarting it doesn't just add a new pig but restarting the whole thing and fix the diamond, row 0 is the default state but when collected it changes to row 1 state and diapear

Worked for 1m 31s

Patched sketch.js with the fixes you asked for.

What I fixed

1. **Restart now resets the whole level**
   - Replaced partial respawn logic with a full world rebuild from the tile map.
   - New helper: rebuildWorldFromLevel (line 1020)
   - restartGame() now calls this, so pigs won't stack on each restart:
     - restartGame (line 996)
2. **Pig overpopulation issue**
   - Confirmed current map has **3 boar spawns** total (not 7 anymore).
   - Full rebuild on restart prevents duplicate boar buildup.
3. **Diamond collect state behavior**
   - On pickup, diamond now:
     - switches to "collect" animation state,
     - waits briefly,
     - then disappears.
   - Pickup logic update: rescueLeaf (line 555)
   - Per-frame collect timer/hide update in draw loop: draw collectible timer block (line 283)
4. **Row 0 idle / row 1 collected support**
   - makeWorld() now defines:
     - idle on row 0
     - collect on row 1 **if row 1 exists**
   - Code: leaf animation setup (line 1062)

Important note about your current diamond.png

Your current file is 180x28, which is **one row only**.
So row 1 does not exist right now. I added a fallback so it still works (collect animation then disappear), but if you want true row-1 collected art, your diamond sheet needs a second row (e.g. 180x56).

Undo

sketch.js

when restarting the game is broken

Worked for 30s

I fixed restart by making it a full hard reset.

Change made

- Updated restartGame() (line 996) to:

```
window.location.reload();
```

This guarantees the game restarts from a clean state every time (no duplicated pigs, no leftover broken state).
If you want, I can also do a second pass to keep restart in-canvas (without page reload) once you share the exact console error you were getting.

Undo

sketch.js

fix the diamond there should be only one diamond where the collactable is at using row 0 from diamond.png for the default state, and when the diamond is collected it turns to row 1 from diamond.png and diapears

Worked for 37s

Done. I patched the diamond logic in sketch.js so it behaves as a 2-state collectible:

- Idle uses **row 0**, single frame (idle)
- On collect it switches to **row 1**, single frame (collect)
- Then it disappears after a short timer

Exact changes

- Added row constants:
  - sketch.js (line 143)
- Updated collect behavior:
  - sketch.js (line 555)
- Updated diamond animation definitions to single-frame states:
  - sketch.js (line 1044)

Important: your current diamond.png is still 180x28 (one row).
I kept a safe fallback so the game won't break, but to actually see row 1 on collect, the file must include a second row (e.g. 180x56).

Undo

sketch.js

make the game easier and remove the white diamond under the blue diamond

Worked for 32s

Done. I patched sketch.js for both requests.

Easier gameplay

- Increased health: maxHealth = 5 (line 83 (line 83))
- Higher jump: PLAYER_JUMP = 5.2 (line 161 (line 161))

- Larger attack range: `ATTACK_RANGE_X = 26`, `ATTACK_RANGE_Y = 18` (lines 164-165 (line 164))
- Weaker/slower boars: `BOAR_SPEED = 0.45`, `BOAR_HP = 2` (lines 170-171 (line 170))

Removed white diamond under blue diamond

- Fixed sprite slicing so diamond uses half-height frames:
  - `COLLECT_FRAME_H = 14` (instead of 28) (line 141 (line 141))
- This correctly separates:
  - row 0 = blue idle
  - row 1 = collected state
- Slight visual alignment tweak: `leaf.anis.offset.y = -2` (line 1055 (line 1055))

If you want it even easier, I can also remove 1 boar spawn from the map.

Undo

sketch.js

make the fire smaller and add in the sound effects and background music

Worked for 48s

Done. I made both requested updates.

1) Fire is smaller

In sketch.js:

- Added fire size constants:
  - `FIRE_SCALE = 0.7`
  - `FIRE_HIT_W = 12`
  - `FIRE_HIT_H = 10`
- Reduced fire hitbox:
  - `fire.w = FIRE_HIT_W`
  - `fire.h = FIRE_HIT_H`
- Reduced fire visual size:
  - `s.scale = FIRE_SCALE` for each fire sprite

2) Sound effects + background music

In index.html:

- Added `p5.sound` CDN script so `loadSound()` works.

In sketch.js:

- Your SFX hooks were already wired (jump/attack/hurt/collect/game over).
- Added a reliability check in `draw()`:
  - if audio is unlocked but music hasn't started yet, it retries `startBackgroundMusic()`.

If you want, I can also lower fire damage frequency (e.g., longer invulnerability after fire hit) to make hazards feel less punishing.
